Project Title - BADASS

Milestone 5: Testing

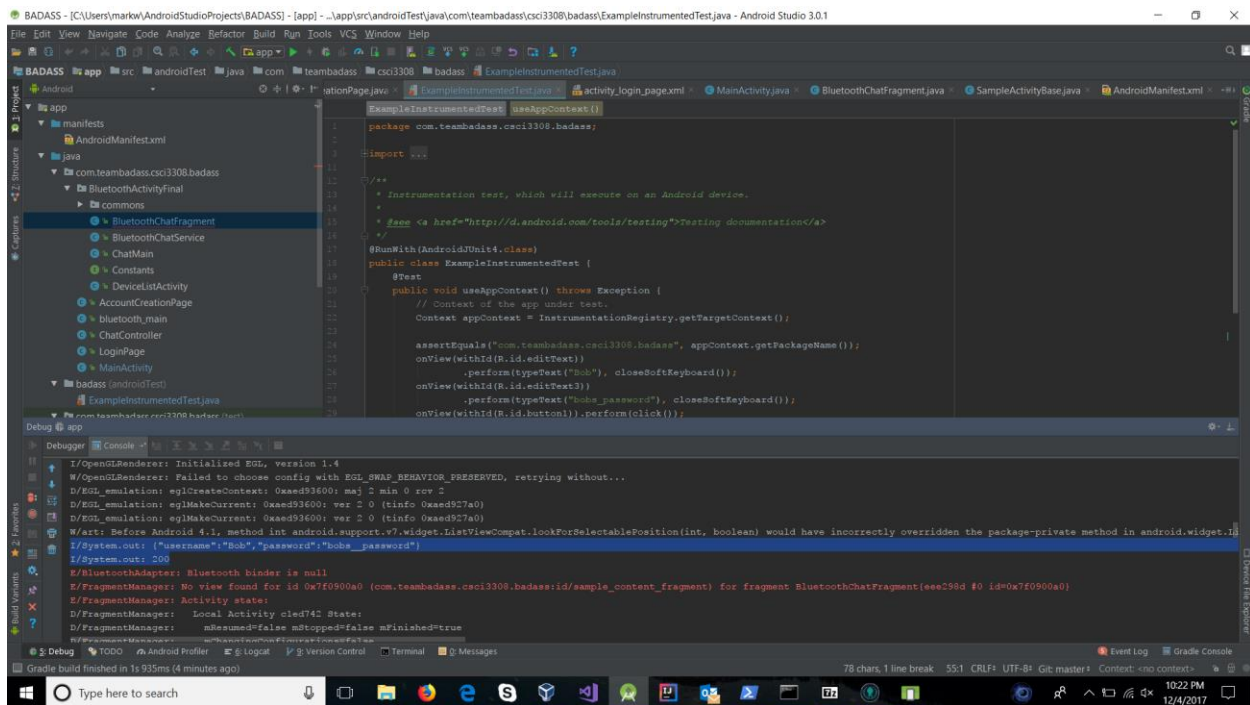

Vision from Milestone 1

We want to create an application that enables users to communicate during disasters without having to rely on cellular towers or wi-fi.

Automated Testing Documentation

We used the Espresso testing framework that comes integrated with Android Studio ([see more information here](#)).

The code for the automated test case we used is included in our repository. We have also added a screenshot of the output from that case below. The test case was to check that the app could successfully log someone in.

1. We want users to be able to create an account, and then log in with that account
⇒ Success!
2. We want users to be able to pick a device
⇒ Success!
3. We want users to be able to send a message
⇒ Success!
