

## Milestone 2 - Team 53, BADASS

Development tool-

Trello - <https://trello.com/b/Tb4WCoYU/csci3308-badass>

2. Number of Sprints: We decided we should do 3 two-week sprints before Nov.20 then continue adding two-week sprints as needed till presentation. Our plan for this sprint is outlined above - the cards in the "To-Do" list are the tasks that we hope to accomplish by the end of this sprint. We added the team member responsible for each task to the card associated with it. At the top of the To-Do list is a card with sprint info - what date the sprint began, and what date it is slated to finish, along with any other information we might feel is necessary.

3. Summary of daily scrum-style meeting we conducted

Member	Accomplished	Challenges	Next Steps
Chloe	Installed Android Studio and started working on account creation page	Having a hard time getting Android Studio to run properly either in VM or on my laptop	Keep trying to get Android Studio working or find a workaround; finish account creation page; research input fields
Mark	Created initial database for users. (Username, password, and primary key fields) in mysql.	Need to have what specific data we are going to be associating with users to build the database up more.	Going to work on the backend Java portion of connecting the account creation/login pages with the database.
Jasmine	Made attempt at	Problems with the	Will use

	complicated location services program following a tutorial that seemed to have errors in it and was incomplete.	tutorial. Some things may have been deprecated. Other things seem to be missing.	android.location.Location class method to get last location instead of gms and figure out how to make a location update loop without a tutorial. Will scrap some of the features from the tutorial that aren't really necessary such as a map activity feature.
Adam	Created the sign in page skeleton, with basic features. Each button and text has their own specific Id's for integration with the back end.	Challenges I face are creating specific images for icons inside the app.	Need to finalize a uniform style for each page for faster integration. Need to push to the main repository from forked repository to have assets available

We plan to conduct a sprint retrospective and assign new tasks at our weekly Monday night scrum, after the first sprint concludes this weekend.
